

1. Install Terminal and SSH on Home Assistant

Go to Settings → Add-ons

Click Add-on Store (bottom right)

Search for "Terminal & SSH" (official Home Assistant add-on)

Click it, then click Install

Once installed, click Start

Open the add-on's Web UI (or find it in your sidebar if it added an icon)

2. Install HACS within the terminal

Run:

```
wget -O - https://get.hacs.xyz | bash -
```

3. Restart Home Assistant

Once it's back up:

Settings > Devices & Services → Add Integration

Search for "HACS"

Follow the on-screen prompts > it will ask you to authorize via GitHub (this is required; HACS pulls custom integrations from GitHub repos)

Complete the GitHub authorization flow in the popup/tab it opens

4. Install Unifi UNAS App

Open HACS

Click HACS in your left sidebar.

Go to Integrations tab

Click Integrations at the top.

Search for the Unifi UNAS App.

Install It.

5. After it installs it should automatically direct you to sign in to your UNAS:

(You must enable SSH in UNAS Settings for this to work)

Enter:

Your UNAS Pro's local IP address

Username: root

Password: the SSH password you set on the UNAS

Select your device model when prompted
